## CARBOXYLIC ACIDS AND ACYLSULFONAMIDES, COMPOSITIONS CONTAINING SUCH COMPOUNDS AND METHODS OF TREATMENT

### BACKGROUND OF THE INVENTION

10        The present invention relates to compounds which are useful for treating or preventing prostaglandin mediated diseases, methods of treatment and pharmaceutical compositions containing such compounds. The compounds are structurally different from conventional NSAIDs and opiates, and are antagonists of the pain and  
15        inflammatory effects of E-type prostaglandins.

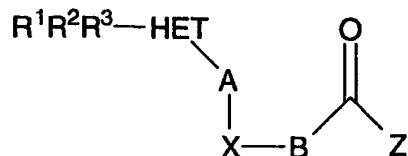

Two review articles describe the characterization and therapeutic relevance of the prostanoid receptors as well as the most commonly used selective agonists and antagonists: *Eicosanoids: From Biotechnology to Therapeutic Applications*, Folco, Samuelsson, Maclouf, 20 and Velo eds, Plenum Press, New York, 1996, chap. 14, 137-154 and Journal of Lipid Mediators and Cell Signalling, 1996, 14, 83-87. An article from *The British Journal of Pharmacology* (1994, 112, 735-740) suggests that Prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) exerts allodynia through the EP<sub>1</sub> receptor subtype and hyperalgesia through EP<sub>2</sub> and EP<sub>3</sub> receptors in the  
25        mouse spinal cord.

Thus, selective prostaglandin ligands, agonists or antagonists, depending on which prostaglandin E receptor subtype is being considered, have anti-inflammatory, antipyretic and analgesic properties, and in addition inhibit hormone-induced uterine contractions. Moreover, the compounds have anti-cancer effects.  
30

The compounds have a reduced potential for gastrointestinal toxicity, a reduced potential for renal side effects, a reduced effect on bleeding times and a lessened ability to induce asthma attacks in aspirin-sensitive asthmatic subjects.

Some of the compounds described herein contain one or more asymmetric centers and may thus give rise to diastereomers and optical isomers. The present invention is meant to comprehend such possible diastereomers as well as their racemic and resolved, 10 enantiomerically pure forms and pharmaceutically acceptable salts thereof.

Some of the compounds described herein contain olefinic double bonds, and unless specified otherwise, are meant to include both E and Z geometric isomers.

15 The pharmaceutical compositions of the present invention comprise a compound of Formula I as an active ingredient or a pharmaceutically acceptable salt, thereof, and may also contain a

5 pharmaceutically acceptable carrier and optionally other therapeutic ingredients. The term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases including inorganic bases and organic bases. Salts derived from inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic salts, manganese, 10 potassium, sodium, zinc, and the like. Particularly preferred are the ammonium, calcium, magnesium, potassium, and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, substituted 15 amines including naturally occurring substituted amines, cyclic amines, and basic ion exchange resins, such as arginine, betaine, caffeine, choline, N,N'-dibenzylethylenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethyl-morpholine, N-ethylpiperidine, glucamine, 20 glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropylamine, tromethamine, and the like.

When the compound of the present invention is basic, salts 25 may be prepared from pharmaceutically acceptable non-toxic acids, including inorganic and organic acids. Such acids include acetic, benzenesulfonic, benzoic, camphorsulfonic, citric, ethanesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, 30 pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic acid, and the like. Particularly preferred are citric, hydrobromic, hydrochloric, maleic, phosphoric, sulfuric, and tartaric acids.

It will be understood that in the discussion of methods of 35 treatment which follows, references to the compounds of Formula I are meant to also include the pharmaceutically acceptable salts.

The magnitude of prophylactic or therapeutic dose of a compound of Formula I will, of course, vary with the nature and the

5 severity of the condition to be treated and with the particular compound  
of Formula I and its route of administration. It will also vary according  
to a variety of factors including the age, weight, general health, sex, diet,  
time of administration, rate of excretion, drug combination and  
response of the individual patient. In general, the daily dose from about  
10 0.001 mg to about 100 mg per kg body weight of a mammal, preferably  
0.01 mg to about 10 mg per kg. On the other hand, it may be necessary to  
use dosages outside these limits in some cases.

The amount of active ingredient that may be combined with  
the carrier materials to produce a single dosage form will vary  
15 depending upon the host treated and the particular mode of  
administration. For example, a formulation intended for oral  
administration to humans may contain from about 0.5 mg to about 5 g of  
active agent compounded with an appropriate and convenient amount of  
carrier material which may vary from about 5 to about 95 percent of the  
20 total composition. Dosage unit forms will generally contain from about 1  
mg to about 2 g of an active ingredient, typically 25 mg, 50 mg, 100 mg,  
200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

For the treatment of any of the prostanoid mediated diseases  
compound I may be administered orally, topically, parenterally, by  
25 inhalation spray or rectally in dosage unit formulations containing  
conventional non-toxic pharmaceutically acceptable carriers, adjuvants  
and vehicles. The term parenteral as used herein includes  
subcutaneous, intravenous, intramuscular, intrasternal injection or  
infusion techniques. In addition to the treatment of warm-blooded  
30 animals such as mice, rats, horses, cattle, sheep, dogs, cats, etc., the  
compound of the invention is effective in the treatment of humans.

The pharmaceutical compositions containing the active  
ingredient may be in a form suitable for oral use, for example, as tablets,  
troches, lozenges, solutions, aqueous or oily suspensions, dispersible  
35 powders or granules, emulsions, hard or soft capsules, syrups or  
elixirs. Compositions intended for oral use may be prepared according  
to any method known to the art for the manufacture of pharmaceutical  
compositions and such compositions may contain one or more agents

- 5 selected from the group consisting of sweetening agents, flavouring agents, colouring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets.
- 10 These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate,
- 15 stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glycetyl monostearate or glycetyl distearate may be employed. They may also be
- 20 coated by the technique described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredients is mixed with water-miscible solvents such as propylene glycol, PEGs and ethanol, or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropyl methylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or

5 condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more colouring agents, one or more flavouring agents, and one or more sweetening agents, such as sucrose, saccharin or aspartame.

10

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

15

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavouring and colouring agents, may also be present.

20

The pharmaceutical compositions of the invention may also be in the form of an oil-in-water emulsion. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

25

5           Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavouring and colouring agents. The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous  
10          suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a  
15          solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. Cosolvents such as ethanol, propylene glycol or polyethylene glycols may also be used. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this  
20          purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Compound I may also be administered in the form of suppositories for rectal administration of the drug. These compositions  
25          can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ambient temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, gels, solutions or  
30          suspensions, etc., containing the compound of Formula I are employed. (For purposes of this application, topical application shall include mouth washes and gargles.) Topical formulations may generally be comprised of a pharmaceutical carrier, cosolvent, emulsifier, penetration enhancer, preservative system, and emollient.

35          The ability of the compounds of Formula I to interact with prostaglandin receptors makes them useful for treating, preventing or reversing undesirable symptoms caused by prostaglandins in a mammalian, especially human subject. This mimicking or antagonism

5 of the actions of prostaglandins indicates that the compounds and pharmaceutical compositions thereof are useful to treat, prevent or ameliorate prostaglandin mediated diseases and conditions in mammals and especially in humans: Pain, fever and inflammation of a variety of conditions including rheumatic fever, symptoms associated  
10 with influenza or other viral infections, common cold, low back and neck pain, skeletal pain, post-partum pain, dysmenorrhea, headache, migraine, toothache, sprains and strains, myositis, neuralgia, synovitis, arthritis, including rheumatoid arthritis, degenerative joint diseases (osteoarthritis), gout and ankylosing spondylitis, bursitis,  
15 burns including radiation and corrosive chemical injuries, sunburns, pain following surgical and dental procedures as well as immune and autoimmune diseases. In addition, such a compound may inhibit cellular neoplastic transformations and metastatic tumor growth and hence can be used in the treatment of cancer. Compound I may also be  
20 of use in the treatment and/or prevention prostaglandin-mediated proliferation disorders such as may occur in diabetic retinopathy and tumor angiogenesis. Compound I will also inhibit prostanoid-induced smooth muscle contraction by antagonizing contractile prostanoids or mimicking relaxing prostanoids and hence may be use in the treatment  
25 of dysmenorrhea, premature labor, asthma and eosinophil related disorders. It will also be of use in the treatment of Alzheimer's disease, the treatment of glaucoma, for the prevention of bone loss (treatment of osteoporosis) and for the promotion of bone formation (treatment of fractures) and other bone diseases such as Paget's disease.

30 By virtue of its prostanoid or prostanoid antagonist activity, compound I will prove useful as an alternative to NSAID'S particularly where such non-steroidal anti-inflammatory drugs may be contraindicated such as in patients with peptic ulcers, gastritis, regional enteritis, ulcerative colitis, diverticulitis or with a recurrent  
35 history of gastrointestinal lesions; GI bleeding, coagulation disorders including anemia such as hypoprothrombinemia, haemophilia or other bleeding problems; kidney disease; thrombosis, occlusive vascular diseases; those prior to surgery or taking anti-coagulants. Compound I

5 will also be useful as a cytoprotective agent for patients under chemotherapy.

Compound of Formula I, will be useful as a partial or complete substitute for conventional antiinflammatory or analgesic compounds in preparations wherein they are presently co-administered  
10 with other agents or ingredients. Thus in further aspects, the invention encompasses pharmaceutical compositions for treating prostaglandin E<sub>2</sub> mediated diseases as defined above comprising a non-toxic therapeutically effective amount of the compound of Formula I as defined above and one or more ingredients such as another pain reliever  
15 including acetaminophen or phenacetin; a COX-2 selective NSAID; a conventional NSAID; a potentiator including caffeine; an H<sub>2</sub>-antagonist, aluminum or magnesium hydroxide, simethicone, a decongestant including phenylephrine, phenylpropanolamine, pseudophedrine, oxymetazoline, ephinephrine, naphazoline, xylometazoline,  
20 propylhexedrine, or levo-desoxyephedrine; an antiitussive including codeine, hydrocodone, caramiphen, carbetapentane, or dextramethorphan; another prostaglandin ligand including misoprostol, enprostil, rioprostil, ornoprostol or rosaproston; a diuretic; a sedating or non-sedating antihistamine. In addition, the invention  
25 encompasses a method of treating prostaglandin E<sub>2</sub> mediated diseases comprising: administration to a patient in need of such treatment a non-toxic therapeutically effective amount of the compound of Formula I, optionally co-administered with one or more of such ingredients as listed immediately above.

30 Compounds of the present invention can be prepared according to the following methods. Temperatures are in degrees Celsius.

35 Boronic acids and esters can be prepared from the corresponding halide according to literature procedure and reference cited therein (Charette, A.B.; Giroux, A. J. Org. In some cases, the triflate, the tin or the zinc derivatives may be used instead of the  
10 boronic acid.

#### Method A

Cinnamic ester **1** is treated with a brominating agent such as NBS in a refluxing inert solvent such as  $\text{CCl}_4$ , with the use of an  
15 initiator like benzoyl peroxide or light. The resulting benzylic bromide is reacted in a Suzuki coupling reaction with the appropriate boronic acid or ester, a catalyst such as tetrakis(triphenylphosphine) palladium and cesium fluoride or  $\text{Na}_2\text{CO}_3$  or a base in an inert refluxing solvent such as DME at 80-90° C. The new cinnamic ester **3** is hydrolyzed with aqueous  
20 sodium hydroxide to afford the acid **4** that is converted to the cinnamic sulfonamide **5** with a coupling reagent such as DCC or DCI in  $\text{CH}_2\text{Cl}_2$  at r.t.

5      Method B

Cinnamic ester **2** is treated with an aryl or heteroaryl mercaptan, alcohol or amine, and with a base such as a hydride or an amine in benzene or THF at 0-23° C. The resulting cinnamic ester **6** is converted to **7** according to Method A.

10     If W= sulfur, it is oxidized to the sulfoxide or sulfone **8** with hydrogen peroxide, m-CPBA or other peracetic acid. The cinnamic ester **8** is converted to **9** according to Method A.

Method C

15     The aldehyde **11** is prepared by an addition-elimination of a mercapto, hydroxy or amino aryl or heteroaryl with a base such as K<sub>2</sub>CO<sub>3</sub> in refluxing CHCl<sub>3</sub>. If needed a higher boiling point solvent can be used. This type of reaction can also be performed with CuO in DMF. An Emmons-Horner type reaction (or Wittig) in toluene at r.t. followed  
20    by Method A (or oxidation as described in Method B) results in the cinnamic sulfonamide **13**.

Method D

25     Acetal **14** that came from an acetalization from a suitably substituted bromo benzaldehyde is converted to the Grignard reagent with magnesium in an etheral solvent at reflux and quenched with an aryl or heteroaryl ketone. The alcohol **16** is reacted with an halide and a base (or protected as the *o*-nitrobenzyl, and removed at the end of the sequence) to furnish the compound **17**. Deprotection of the acetal under  
30    standard conditions followed by Method C gives **18**.

Method E

35     Alcohol **16** is converted to an acetate with acetyl chloride (or acetic anhydride and an amine base) and coupled with a Grignard reagent and a copper salt at low temperature. The alcohol **16** could also be converted to the bromide and treated in a similar way to yield **20**. Alternatively the tetramethyl acetal (R= methyl) version of alcohol **16** can be treated with TiCl<sub>4</sub>/Me<sub>2</sub>Zn (or R<sup>7</sup><sub>2</sub>Zn) at -30 °C. Compound **20** is then

5 converted to the cinnamic sulfonamide **21** according to Method D. Also, **22** can be treated with  $\text{Al}(\text{R}^7)_3$  in toluene at 80 °C for 24h and **23** converted to the aldehyde with n-BuLi/DMF followed by an Emmons-Horner reaction and Method A to yield compound **21**.

10 **Method F**

A suitably substituted bromo toluene **24** is treated with n-BuLi at low temperature and quenched with an aryl or heteroaryl aldehyde. The resulting alcohol is oxidized to the ketone with PDC, PCC,  $\text{MnO}_2$  or other typical oxidizing agent. The carbonyl is treated with  $\text{SF}_4$ , **15**  $\text{MoF}_6\text{-BF}_3$  (or converted to a thioacetal and treated with nitrosonium  $\text{BF}_4^-$ -pyridinium•HF) to yield the difluoride. Benzylic bromination with NBS followed by oxidation with N-methylmorpholine N-oxide at 100 °C in dioxane for 4 h, yielded compound **25** that is converted to cinnamic sulfonamide **26** with Method C.

20

**Method G**

The appropriately substituted methyl bromo(or triflate) benzoate **27** is converted to compound **28** by a Suzuki coupling reaction followed by hydrogenation. A Stille coupling reaction could also be used. **25** Benzylic bromination or benzylic oxidation followed by treatment with a brominating agent such as  $\text{CBr}_4$ /triphenylphosphine gives compound **29** which can be treated with a boronic acid, or a tin compound (Stille) to furnish compound **30**. Reduction of the ester with DIBAL, oxidation with  $\text{MnO}_2$  and Method C gives compound **31**.

30

**Method H**

Compound **29** (one  $\text{R}^7 = \text{H}$ ) is treated with triphenyl phosphine to give the salt and, with a base such as LDA, is converted to compound **32** with the aryl or heteroaryl ketone. The halide **29** can also **35** be converted the Grignard reagent and added to the ketone. Dehydration under acidic conditions results in compound **32**. Reduction of the double bond under standard conditions, followed by Methods G and C gives compound **33**. From compound **32**, cyclopropanation with

5 diazomethane and palladium (0) followed by Methods G, C and A gives compound **34**.

5    Method I

The (heterocyclic) vinylic bromide 35 is reacted in a Suzuki coupling reaction with an aryl or hetero aryl boronic acid and converted to a new borane by 9-BBN addition followed by a second Suzuki reaction with compound 14. Compound 37 thus formed is reduced by 10 hydrogenolysis ( H<sub>2</sub>/metal or diimide) and deprotection followed by Method C gives cinnamic sulfonamide 39.

Method J

Ketone 40 which comes from oxidation of the corresponding 15 alcohol is reacted with a phosphonium salt or phosphono ester with a base such as LDA to give the cinnamic ester 41. Method A yields 42 and reduction of the double bond by the previously mentioned method gives the acyl sulfonamide 43.

20    Method K

Cinnamic ester 3 is reduced to 44 by the previously mentioned method.  $\alpha$  Alkylation with a base such as LDA followed by an alkylating agent results in 45 after conversion to the acyl sulfonamide.

25    Method L

Cinnamic ester 3 is reduced to 46 with DIBAL and the double bond converted to a cyclopropane by a Simmons-Smith reaction, or similar reactions recently described in the literature. Compound 47 is then oxidized and the cinnamic sulfonamide 48 is prepared according to 30 Method A.

Method M

Ester 49 which can come from the homologation of the appropriately substituted methyl ortho-toluate, is treated with a base and 35 with an alkylating agent to furnish compound 50. Benzylic bromination and Suzuki coupling gives an intermediate ester. Homologation according to *J. Amer. Chem. Soc.*; 1985, 1429; *J. Org. Chem.* 1992, 7194,

5 followed by alkylation with a base such as LDA and an alkylating agent furnishes acylsulfonamide **51** by Method A.

Compound **50** can also be converted to the benzylic bromide and to compound **52** by Method A.

10 **Method N**

Suitably substituted compound **53** is treated with a boronic acid to give compound **54** which is reduced with LDA to the alcohol **55**. Treatment with phosgene followed with the appropriate sulfonamide gives compound **56**. This can also be prepared by mixing phosgene and the sulfonamide at 140°C to generate the isocyanate.

Compound **54** is treated with a Grignard reagent to give the corresponding alcohol and as previously described, converted to compound **57**.

20 **Method O**

Ester **58** is treated with Lawesson's reagent, DAST and light to give the benzylic alcohol **59**. The procedure according to Method N yields compound **60**.

25 **Method P**

Compound **59** is brominated as described earlier (or iodinated) and reacted in a S<sub>N</sub>2 type reaction with an ester and a base such as LDA to furnish ester **61**. Method A gives the acylsulfonamide **62**.

30

**Method Q**

Compound **55** is treated with NH<sub>3</sub>/Ph<sub>3</sub>P/DEAD (or treated with CBr<sub>4</sub>/Ph<sub>3</sub>P and the bromide converted to the amine **63** with ammonia). Treatment with phosgene followed by sulfonamide yields **64**, treatment of which with a base and an alkyl or benzylic halide gives compounds **65**.

**Method R**

5               Aldehyde **10** is treated with a silylated source of hydroxyl or thiol at 80-130 °C, and the silyl group removed by fluoride treatment. Compound **66** is then treated with an aryl or heteroaryl methylene bromide with a base such as a tertiary amine in CHCl<sub>3</sub> or benzene to yield aldehyde **67**. Emmons-Horner (or Wittig reaction) with LDA  
10    results in compound **68** via Method A.

#### Method S

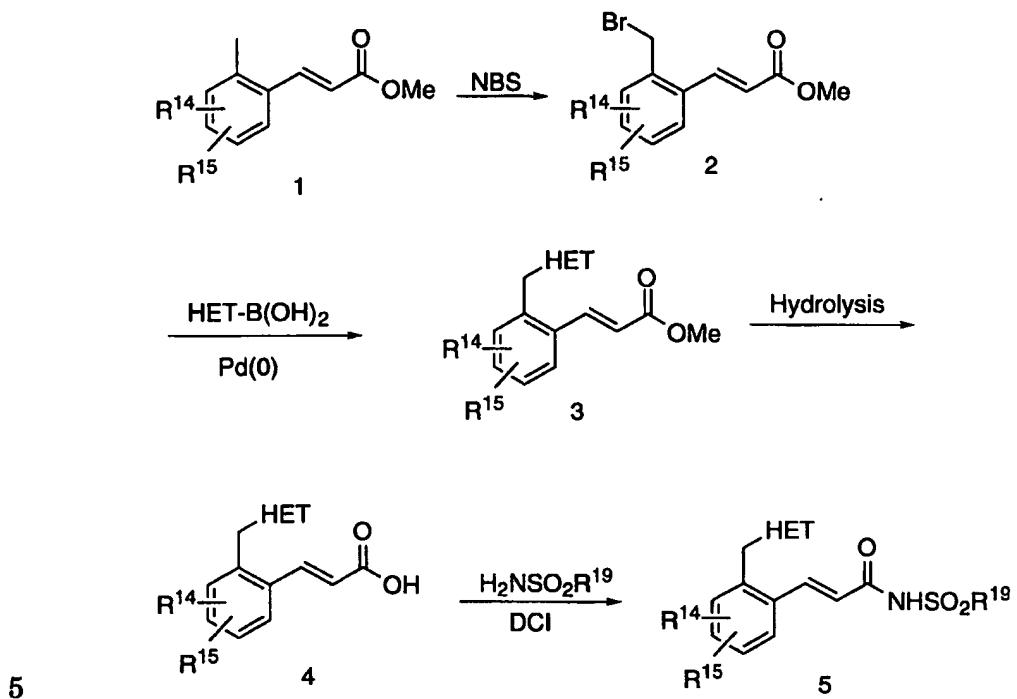

In the case of an amine an alternative to method R can be used. A suitably substituted nitro aldehyde **69** is converted to compound  
15    **70** as described earlier and the nitro group reduced with standard methods. Mono-alkylation followed by displacement with an aryl or heteroaryl methylene bromide and processing by Method A yields cinnamic sulfonamide **71**.

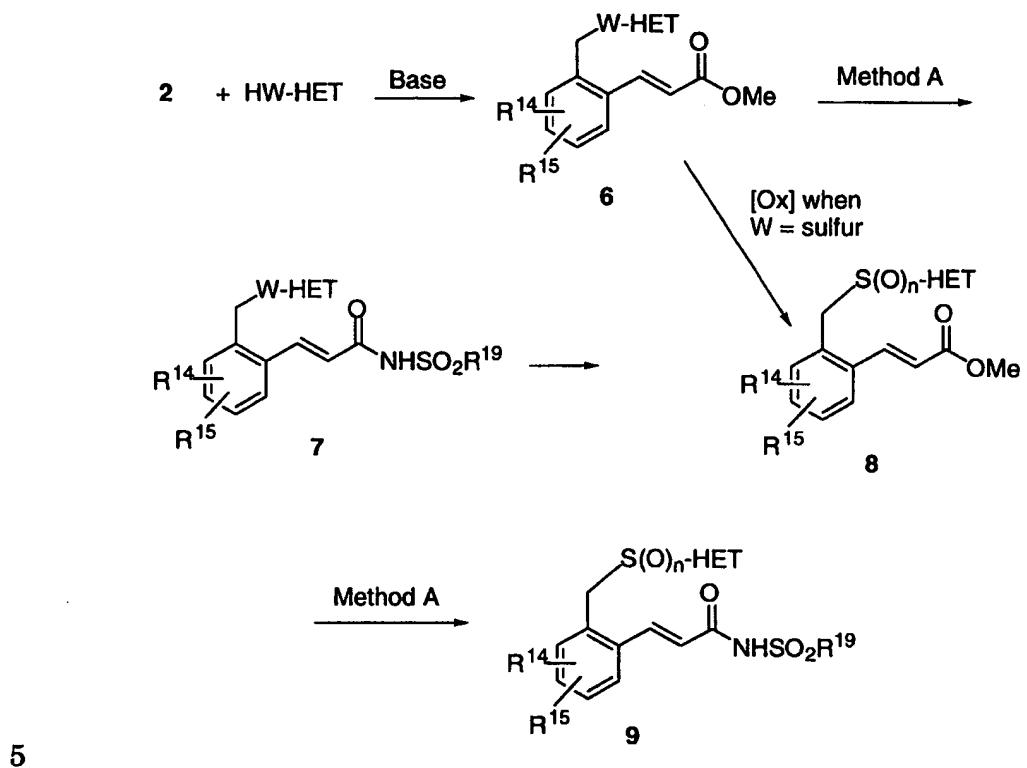

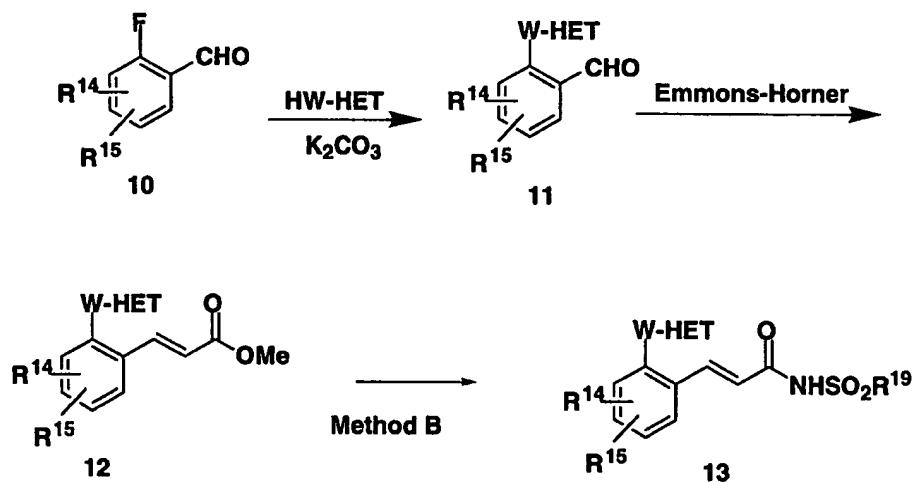

#### 20    Method T

A suitably substituted bromo toluene **24** is converted to the anion in an ethereal solvent at low temperature and trapped with an aldehyde of an aryl or heteroaryl. The resulting alcohol is oxidized with MnO<sub>2</sub>, Jones' reagent, PDC, PCC or any other oxidant. Benzylic  
25    bromination followed by oxidation with N-methyl morpholine N-oxide, yields a ketoaldehyde. Emmons-Horner and Method A gives the cinnamic sulfonamides **72**.

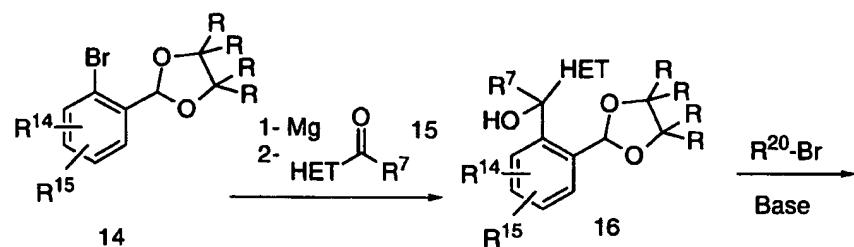

Generic structures 4, 5, 7, 9, 13, 18, 21, 26, 31, 33, 34, 39, 42,

## ASSAYS FOR DETERMINING BIOLOGICAL ACTIVITY

Biological activity and thus utility for the compounds of formula I as modulators of prostaglandin mediated diseases can be demonstrated in accordance with the following assays which demonstrate prostanoid antagonist or agonist activity *in vitro* and *in vivo* and their selectivity. The prostaglandin receptors investigated were DP, EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>3</sub>, EP<sub>4</sub>, FP, IP and TP.

15 Stable expression of prostanoid receptors in the human embryonic kidney (HEK) 293(ebna) cell line

5 Prostanoid receptor cDNAs corresponding to full length  
coding sequences were subcloned into the appropriate sites of  
mammalian expression vectors and transfected into HEK 293(ebna)  
cells. HEK 293(ebna) cells expressing the individual cDNAs were grown  
under selection and individual colonies were isolated after 2-3 weeks of  
10 growth using the cloning ring method and subsequently expanded into  
clonal cell lines.

Prostanoid receptor binding assays

HEK 293(ebna) cells are maintained in culture, harvested  
15 and membranes are prepared by differential centrifugation, following  
lysis of the cells in the presence of protease inhibitors, for use in receptor  
binding assays. Prostanoid receptor binding assays are performed in 10  
mM MES/KOH (pH 6.0) (EPs, FP and TP) or 10 mM HEPES/KOH (pH 7.4)  
(DP and IP), containing 1 mM EDTA, 10 mM divalent cation and the  
20 appropriate radioligand. The reaction is initiated by addition of  
membrane protein. Ligands are added in dimethylsulfoxide which is  
kept constant at 1 % (v/v) in all incubations. Non-specific binding is  
determined in the presence of 1  $\mu$ M of the corresponding non-radioactive  
prostanoid. Incubations are conducted for 60 min at room temperature  
25 or 30 °C and terminated by rapid filtration. Specific binding is calculated  
by subtracting non specific binding from total binding. The residual  
specific binding at each ligand concentration is calculated and  
expressed as a function of ligand concentration in order to construct  
sigmoidal concentration-response curves for determination of ligand  
30 affinity.

Prostanoid receptor agonist and antagonist assays

Whole cell second messenger assays measuring  
stimulation (EP<sub>2</sub>, EP<sub>4</sub>, DP and IP in HEK 293(ebna) cells) or inhibition  
35 (EP<sub>3</sub> in human erythroleukemia (HEL) cells) of intracellular cAMP  
accumulation or mobilization of intracellular calcium (EP<sub>1</sub>, FP and TP  
in HEK 293(ebna) cells stably transfected with apo-aequorin) are  
performed to determine whether receptor ligands are agonists or

5 antagonists. For cAMP assays, cells are harvested and resuspended in HBSS containing 25 mM HEPES, pH 7.4. Incubations contain 100 µM RO-20174 (phosphodiesterase type IV inhibitor, available from Biomol) and, in the case of the EP<sub>3</sub> inhibition assay only, 15 µM forskolin to stimulate cAMP production. Samples are incubated at 37°C for 10 min,

10 the reaction is terminated and cAMP levels are then measured. For calcium mobilization assays, cells are charged with the co-factors reduced glutathione and coelenterazine, harvested and resuspended in Ham's F12 medium. Calcium mobilization is measured by monitoring luminescence provoked by calcium binding to the intracellular

15 photoprotein aequorin. Ligands are added in dimethylsulfoxide which is kept constant at 1 % (v/v) in all incubations. For agonists, second messenger responses are expressed as a function of ligand concentration and both EC<sub>50</sub> values and the maximum response as compared to a prostanoid standard are calculated. For antagonists, the

20 ability of a ligand to inhibit an agonist response is determined by Schild analysis and both K<sub>B</sub> and slope values are calculated.

5    Adjuvant-Induced Arthritis in Rats

Female Lewis rats (body weight ~146-170 g) were weighed, ear marked, and assigned to groups (a negative control group in which arthritis was not induced, a vehicle control group, a positive control group administered indomethacin at a total daily dose of 1 mg/kg and four groups administered with a test compound at total daily doses of 0.10-3.0 mg/kg) such that the body weights were equivalent within each group. Six groups of 10 rats each were injected into a hind paw with 0.5 mg of *Mycobacterium butyricum* in 0.1 mL of light mineral oil (adjuvant), and a negative control group of 10 rats was not injected with adjuvant. Body weights, contralateral paw volumes (determined by mercury displacement plethysmography) and lateral radiographs (obtained under Ketamine and Xylazine anesthesia) were determined before (day -1) and 21 days following adjuvant injection, and primary paw volumes were determined before (day -1) and on days 4 and 21 following adjuvant injection. The rats were anesthetized with an intramuscular injection of 0.03 - 0.1 mL of a combination of Ketamine (87 mg/kg) and Xylazine (13 mg/kg) for radiographs and injection of adjuvant. The radiographs were made of both hind paws on day 0 and day 21 using the Faxitron (45 kVp, 30 seconds) and Kodak X-OMAT TL film, and were developed in an automatic processor. Radiographs were evaluated for changes in the soft and hard tissues by an investigator who was blinded to experimental treatment. The following radiographic changes were graded numerically according to severity: increased soft issue volume (0-4), narrowing or widening of joint spaces (0-5) subchondral erosion (0-3), periosteal reaction (0-4), osteolysis (0-4) subluxation (0-3), and degenerative joint changes (0-3). Specific criteria were used to establish the numerical grade of severity for each radiographic change. The maximum possible score per foot was 26. A test compound at total daily doses of 0.1, 0.3, 1, and 3 mg/kg/day, indomethacin at a total daily dose of 1 mg/kg/day, or vehicle (0.5% methocel in sterile water) were administered per os b.i.d. beginning post injection of adjuvant and continuing for 21 days. The compounds were

5 prepared weekly, refrigerated in the dark until used, and vortex mixed immediately prior to administration.

The invention is illustrated in connection with the following non-limiting Examples. All the end products of the formula I were analyzed by NMR, TLC and mass spectrometry.

10 Intermediates were analyzed by NMR and TLC.

Most compounds were purified by flash chromatography on silica gel. Recrystallization and/or swish (suspension in a solvent followed by filtration of the solid) with a solvent such as ether:hexane 1:1.

15 The course of reactions was followed by thin layer chromatography (TLC) and reaction times are given for illustration only.

Temperatures are in degrees Celsius.

The compounds of the examples are numbered in accordance with the compounds that appear in Tables I and II.

(E)-3-{4-CHLORO-2-[6-FLUORO-2-NAPHTHYL]METHYL}PHENYL}-2-  
PROPENOIC ACID SODIUM SALT (457)Step 1: Ethyl (E)-3-(5-chloro-2-methylphenyl)-2-propenoate

10 To 2-bromo-4-chloro toluene (20.0g; 97.3 mmol) in 300 mL of THF at -78 oC was added n-BuLi 2.5 M (40.8 mL) dropwise. After 20 min. 1-formylpiperidine (11.4 mL; 103.0 mmol) in 10 mL of THF was added dropwise. After 30 min the reaction mixture was brought to 0°C and quenched with HCl (10%) and diluted with EtOAc. The organic  
15 phase was collected, dry and the solvent evaporated to yield 13.3g (89%) of 5-chloro-2-methylbenzaldehyde. This crude aldehyde was mixed with 1.1 equivalent of triethyl phosphonoacetate in THF. Sodium hydride 80% (1.3 equivalent ) was added portionwise and 1 h later the reaction was quenched with 25% NH4Cl. The reaction mixture was diluted with  
20 EtOAc and the organic phase collected, dried and the solvent removed. The crude oil was purified on a short pad of silica gel using 5% EtOAc in hexane to afford 16.67 g of the title compound.

25 Alternatively, this procedure can be done in one reaction vessel. At the end of the first step, the flask is brought to rt and the phosphonoacetate in THF is added.

Step 2: Ethyl(E)-3-[2-(bromomethyl)-5-chlorophenyl]-2-propenoate

30 The bromination was done according to step 2 of example 1 to provide the title compound in 45% yield.

35 Step 3: 6-Fluoro-2-naphthol

A solution of 2-(4-fluorophenyl)acetyl chloride (5.0g; 29 mmol) in CH<sub>2</sub>Cl<sub>2</sub> was added to AlCl<sub>3</sub> (7.73g;58 mmol) in CH<sub>2</sub>Cl<sub>2</sub> at -20 °C over 30 min. Trimethylsilyl acetylene (9.96g; 101.43 mmol) was added also over 30 min and stirred at -10 °C for 1h. The mixture was poured in

5 ice and extracted with EtOAc. The organic phase was washed with water, NaHCO<sub>3</sub> and brine. After purification by gel silica chromatography (10% EtOAc in hexane) 2.43 g (36%) of 3-(trimethylsilyl)-6-chloro-2-naphthol was collected. The desylation was done with TFA in CH<sub>2</sub>Cl<sub>2</sub> at rt overnight. Purification by gel silica chromatography (10% EtOAc in hexane) afforded the title compound in 69% yield.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/CA 99/00212

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: **20-25**  
because they relate to subject matter not required to be searched by this Authority, namely:  
**Remark:** Although claims 20-25  
are directed to a method of treatment of the human/animal  
body (PCT rule 39.1(iv)), the search has been carried out and based  
on the alleged effects of the compounds.
2.  Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.
